## 2 Bugs fixed since previous Public Release

This section provides a summary of bug fixes and changes that have been applied subsequently to shipping Patch Release #5274.

### **65410 Calendar items in shared / public calendar are always using the calendar color for other users but the owner**

Appointment color was only considered if the user is the owner of an event such that the user can select the color for the whole public folder.

Now the appointment colors are considered for organizers and organizers\_on\_behalf.

### **65533 Attachment from external ics invite not present in Calendar meeting**

CID URLs in iMIP were not encoded and decoded correctly, so that the referenced MIME part could not be looked up successfully.

This has been solved by correcting encoding and decoding of "cid" URLs in invitation mails.

### **65688 Mail forwarded to gmail receives delivery failure**

Incorrect initialization of in-memory byte array when transferring nested message's data to new message. The generated byte array contains a 0-byte remainder.

Solution: Proper initialization of in-memory byte array, which prevents from 0-byte remainder.

## 3 Tests

Not all defects that got resolved could be reproduced within the lab. Therefore, we advise guided and close monitoring of the reported defect when deploying to a staging or production environment. Defects which have not been fully verified, are marked as such.

To avoid side effects, the shipped packages have gone through automated regression test on both, a Continuous Integration System and a dedicated server set-up for system and integration testing. All changes have been checked for potential side-effects and effect on behavior. Unless explicitly stated within this document, we do not expect any side-effects.

## 4 Fixed Bugs
