## 2 Bugs fixed since previous Public Release

This document provides a summary of bugfixes and changes that have been applied subsequently to shipping Patch Release #2637.

### **39974 HTTP500 response when triggering reload of AppSuite with IE10**

SAML related server responses did not contain the "Pragma no-cache" headers. This made IE10 re-using outdated authentication data when reloading the browser. This has been fixed by adding the corresponding HTTP headers to SAML responses.

### **37948 Sessions invalidated when using multiple tabs with AppSuite**

When disabling autologin at the backend, each additional instance of AppSuite will require the user to re-login. In this scenario other sessions which may be active at the same browser, for example at other tabs, get terminated by the additional login. This has been solved by implementing a SAML specific auto-login mechanism which is based on non-persistent cookies. To enable this mode, set `com.openexchange.saml.enableAutoLogin` (Default: `false`) to `true`.

## 3 Changes relevant for Administrators

### 3.1 Changes of Configuration Files

#### **Change #2673 SAML implementation was extended by an optional auto-login mechanism**

The option `com.openexchange.saml.enableAutoLogin` (Default: `false`) has been added to `saml.properties`. It allows to use a auto-login mechanism in combination with SAML. Please check the configuration file for a more detailed description.

## 4 Tests

The Open-Xchange QA team has successfully verified all bug fixes that could be reproduced within a lab environment.

To avoid side effects, the shipped packages have gone through automated regression test on both, a Continuous Integration System and a dedicated server setup for system and integration testing.

All changes have been checked for potential side-effects and effect on behavior. Unless explicitly stated within this document, we do not expect any side-effects.

## 5 Fixed Bugs
