2 Bugs fixed since previous Public Release

This section provides a summary of bug fixes and changes that have been applied subsequently to shipping Patch Release #5507.

68477 Account update Pop up is not displaying when editing external account under Setting-Accounts

Was caused by deferred object that was not resolved correctly in some cases.
This has been solved by always resolving object correctly.

68803 OX drive disappears

Actually undefined properties are cached at the "configuration" provider of the config cascade once they've been queried for the first time. This happens implicitly when the final scope is determined for a property that was picked up at another level of the config cascade. In case such properties are prefixed with "com.openexchange.capability.", they're also considered and evaluated to "false" when constructing the capability set for any other user, potentially overriding module permissions if they've been used in a discouraged way of using the permission identifier as capability property name.

This has been fixed by ignoring undefined capability properties when building the capability set, added debug logging to reveal problematic configurations.

3 Tests

Not all defects that got resolved could be reproduced within the lab. Therefore, we advise guided and close monitoring of the reported defect when deploying to a staging or production environment. Defects which have not been fully verified, are marked as such.

To avoid side effects, the shipped packages have gone through automated regression test on both, a Continuous Integration System and a dedicated server set-up for system and integration testing. All changes have been checked for potential side-effects and effect on behavior. Unless explicitly stated within this document, we do not expect any side-effects.

4 Fixed Bugs
